

New DRV rotary valve

Britton Procol Valves have extended their range of Bulk Solids Valves with the introduction of a NEW ROTARY VALVE.

Since the launch of our new „DRV%00 rotary valve earlier this year, which has been designed specifically for use with dust collectors and cyclones, it has proved to be a great success with both new and existing customers.

These valves have been designed with robust cast iron bodies with stiffening ribs to prevent distortion under load and body inlets have integral shear planes to reduce product-shearing loads.

Valve bodies have square inlets and round outlets enabling the valves to be connected to equipment with

either round or square connections.

Rotors are fabricated in mild steel with closed ends, 8 blades and heavy duty shafts to withstand the differential pressures normally found in filter and cyclone applications.

Drive is provided by a worm geared motor flange mounted from the valve end-plate and direct coupled to the rotor shaft.

As with all of the Britton Procol range the DRV rotary valve is extremely competitively priced, starting from £440.00 with ex stock deliveries. ●
